

**IMPORTANT NOTICE**  
**Regarding Changes to the Village Water System**

***New Wells and Iron Removal Treatment Plant Operational***

The Waterford Water Utility has installed two new wells and an iron removal treatment plant that will go into operation on **April 10, 2006**.

Along with the start up of the new wells and treatment plant, we will be raising chlorine levels in the water as required by the DNR.

The Utility's spring flushing program will also begin on April 10<sup>th</sup> and will continue for an extended period. We will be flushing for several weeks to assist us in the transition to the new water plant and pumping system.

You may see a reddish-brown coloration in your water as a result of the start up process and hydrant flushing. The water will be sampled frequently and it will continue to meet all standards for safe consumption.

The reddish-brown water may cause some rust colored staining in plumbing fixtures and some discoloration of laundry, particularly whites. If staining occurs, we recommend that you purchase a product called **Super Iron Out** and have it on hand. **Super Iron Out** will safely remove any discoloration from your laundry and plumbing fixtures. It is available at most grocery and hardware stores.

If you experience a persistent problem, or if you have questions or concerns please call us at 534-4069. Waterford Water Utility employees will be happy to respond to each individual situation.

Thank you for your patience and understanding.
